March 2008

Waterless wall urinal

Follow your nose no longer

Hard to believe, but unfortunately it still happens today: To find the way to the gentlemen's restroom, one just needs to follow one's nose. Unpleasant odours dominate, especially in high-use sanitary installations where there are frequently changing users. This does not have to be the case any longer. Standards of cleanness, hygiene and economical efficiency should apply for all urinal installations.

Franke's waterless wall urinal pod now ensures an odourless environment. A waste outlet fitting consisting of a stainless steel sieve and an innovative silicone membrane provides an odour seal. Thanks to the capillary effect of the silicone membrane, the urine is drawn into the drain pipe. The key advantage of this membrane is that no water flush is necessary which saves water and energy. For example, if a urinal is flushed 150 per day, the water savings amount to 300 litres per urinal/per day, i.e. 109,500 litres per year!

Other operating costs do not arise because no barrier liquid is needed for this product, unlike alternative no-water urinal systems. Because even if barrier liquids are used, this does not necessarily prevent urine deposits as they occur with conventional water flushing systems.

To clean Franke's odour-free urinals, a mild all-purpose cleaner used once per day is sufficient. The robust, waterless wall urinal is also easy to install and has low maintenance.

Please send a copy of use if distributing this document

Franke's waterless urinal incorporates an innovative special membrane that works as an odour trap.
